

Frontend developer Role:-

Documentation file detailing the design approach and choices used in the code design.

Languages used :- Html , CSS, JavaScript.

Code editor :- Visual Studio Code.

App deployment Platform :- Vercel.

Version Control :- Github.

Description:-

Here I have created a frontend page, the UI of the page has developed in such a way that the page must contain 3 lists.

1. To Do
2. Doing
3. Done

For that i've designed the skeleton of the page using html and for making it more attractive i've used css and javascript for the dynamic behaviour of web app.

At the top of the page there is one input field and Add button by which we can add the to do in the list.

After that i've created 3 lists in which i've used drag and drop properties by which we can drag & drop the item from one list to the another list as per the requirement of the user. For that i've used some javascript function and logic.

It's all about the task solution and the logic.

After all the completion of the task i've uploaded from Visual Studio code to the github repository.

And after uploading on github i've deployed the app using Vercel.
